

I'm Chung-Hau Wang. I graduated from the University of Southern California (USC) with M.S. in mechanical engineering and specified in control and engineering design. I'm a mechanical engineer and now working as the Junior Manufacturing Engineer in Meritek Electronics Inc. USA, which is a supplier and manufacturer focusing on the chargers for electric vehicles (EV) for major client SIEMENS.

I was born in a family of doctors and engineers, and I believe it's the environment of human science and engineering which make me a man of thoughtfulness and flexible thinking. Since my childhood, I've been open-minded to miscellaneous things, and so am I interested in and taking part in activities of different areas. However, as the time goes by, I was focusing more on human care and engineering areas. I majored in mechanical engineering when I was in college, and I also endeavored to learn knowledge about medicines. I've been observing human's need, and I designed for that. I like to participate in practical projects instead of staying in environment of pure academy so that I attended the Club of Innovation and have been keeping developing the design from 2006 Taiwan Innovative Mechanism Design Competition, where I won the national Top Prize.

I've been hunger for knowledge, intrepid, and relentless. I came to the United States for pursuit of higher degree and mainly for the ambience of openness and innovation. I realized that accomplishment isn't from what I've learnt but what I'm doing. I further self-learning more powerful tools and skills to help myself understand more and doing more in the future. Right now, I'm self-learning how to program android apps, gleaned class materials, like algorithm, from friends to study, and launched small projects to do design by means of 3D printer.

I'm optimistic and never give-up. The environment in which I was growing up build me with interests in human care and engineering; the travelling experience abroad for pursuing knowledge build me with different ways of thinking. The environment and the travelling experience combines to shape me as a man of my age: A man of confidence and energy. I believe that basing on my background and skills, my personality and character will further make me a good fit beyond the other candidates.
